1.1.1 — SAME ENGINE FIXES IN THE PHONE SHELL

2026-11-01

- The phone build carries the same 1.1.1 engine, FX, export and capture fixes as the desktop build.
- The capture graph is torn down on unmount and a `getUserMedia` that resolves after unmount is cancelled.
- A Kokoro timeout clears the loading state and reports the reason, so the Listen control does not stay on “Loading…”.
- The rating listen gate re-renders from the RAF loop, so “Choose” becomes available when playback finishes.
- Download URLs are revoked after the click rather than immediately, and the mic-calibration battery listener is removed on unmount.

1.1.0 — PHONE LAYOUT BASELINE

2026-10-28

- Same five-stage pipeline served to a phone viewport.
- Pinned transport and horizontal stage tabs.
- Touch-sized sample selection handles and paged mixer.
- PWA install and offline app-shell cache.

1.0.0 — PHONE ENTRY

2026-10-26

- Mobile layout for the lab and the /field capture entry.
- Local-first storage with no account requirement.
